

As most of the comments from the Hi-Fi usability evaluation between teams were positive and did not have any pressing concerns, there was not much that we could add or change from our prototype. Most of our fellow classmates liked the design of the website and the navigation system, this was good news to hear as this showed our group that the elements in our prototype made sense to other people outside our group. One of the comments of slight concern was that we could potentially add a home button, rather than our current design of having the home button being directly integrated into the logo of the header. We decided as a team that this change would not be necessary, as it would add some extra clutter and it is common practice to have the home button be directly integrated in the logo. Nevertheless, the limited comments on areas of improvement and the positive comments were a good sign that as a group we had formulated a well balanced hi fi prototype and can use the prototype as a guideline to create a full-blown prototype website.
